

This book reports our research on detection of change processes that underlie psychophysical, learning, medical diagnosis, military, and production control situations, and share three major features. First, the states of the process are not directly observable but become gradually known with the sequential acquisition of fallible information over time. Second, the mechanism that generates the fallible information is not stationary; rather, it is subjected to a sudden and irrevocable change. Thirdly, incomplete, probabilistic information about the time of change is available when the process commences. The purpose of the book is to characterize this class of detection of change processes, to derive the optimal policy that minimizes total expected loss, and, most importantly, to develop testable response models, based on simple decision rules, for describing detection of change behavior. The book is theoretical in the sense that it offers mathematical models of multi-stage decision behavior and solutions to optimization problems. However, it is not anti-empirical, as it aims to stimulate new experimental research and to generate applications. Throughout the book, questions of experimental verification are briefly considered, and existing data from two studies are brought to bear on the validity of the models. The work is not complete; it only provides a starting point for investigating how people detect a change in an uncertain environment, balancing between the cost of delay in detecting the change and the cost of making an incorrect terminal decision.

Materials Issues in Microcrystalline Semiconductors: Volume 164 (MRS Proceedings), Field to Flask: The Fundamentals of Small Batch Distilling, The Chinese Celebrities documentary] last interview (senior Chinese Communist political and military leadership of the famous Democrats volume)(Chinese Edition), Adolescent Psychiatry, V. 28: Annals of the American Society for Adolescent Psychiatry, PHR and SPHR Study Guide, Which?
